

# Water Bottle Filling Station

Thank you for filling your re-usable bottles and cups here at our USPW Water Bar, and doing your part to reduce plastic waste! You are part of a movement which is effectively preventing 100s of 1000s of single-use plastic bottles from going to landfill or ending up in the Pacific Ocean's gyre of plastic.

The USPW Water Bar has been designed as a zero-waste unit, and transforms readily available municipal water into delicious thirst quenching, straight-up water, free of chlorine and other unwanted tastes and odors.

The high capacity carbon filter system, uses granular activated carbon made from compostable coconut shell, housed in a stainless steel tank, and a 1 micron carbon block polishing filter manufactured using a patented process that significantly reduces harmful Green House Gas Emissions. As water passes through the micro pores of the carbon medium, organics in the water "hang on to" (or are "adsorbed"), and molecularly bond with the carbon, resulting in high quality drinking water for you at the spigot. All filters, tanks, parts, fittings, and tubing used in the system are NSF certified.

Since 1985, U.S. Pure Water has been providing ecological and economical alternatives to bottled or tap water, by installing and servicing water treatment technology that is tailored for each specific point of use or point of entry application (your kitchen sink, break room at work, at restaurants and grocery stores.)

Enjoy the Monterey Jazz Festival, and stay hydrated!
